Project Arogya

By Team Swasthya Mochan

Domain : Agriculture, FoodTech & Rural Development

PSID : SIH1325

Problem Statement Title : AI Assisted Tele-medicine KIOSK for Rural India

Ministry/Organization Name/Student Innovation : Government of Kerala

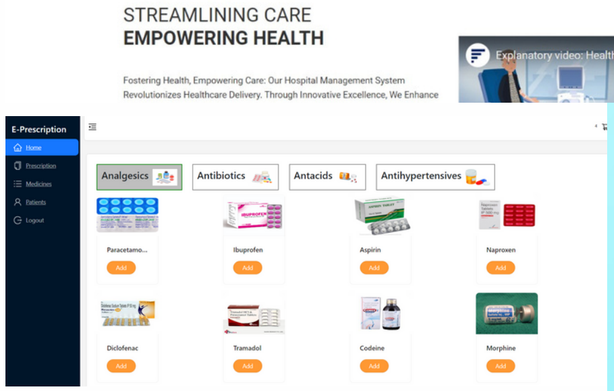
Project Features

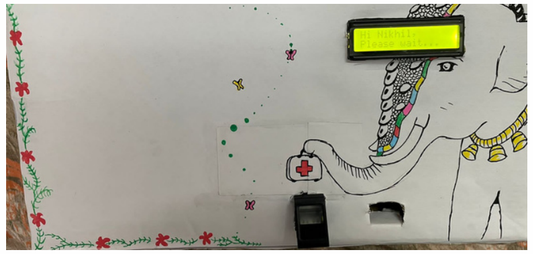
Project Arogya introduces Bemax, an IoT-based AI Assisted kiosk system with multilingual support, enabling remote healthcare access in rural India with integrated Telemedicine Webapp platform.

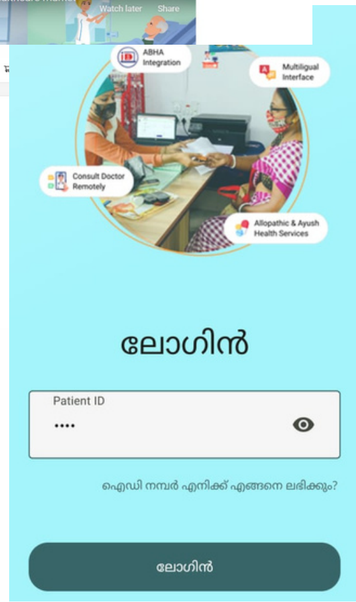
Bemax combines AI-driven symptom analysis, telemedicine consultations, and offline connectivity to enhance healthcare delivery, bridging the gap in underserved areas.

Features :

- Identification of a patient through biometric sensor and face detection
- Pulse and Spo2 data collection.
- Multilingual ai and platform support for rural patients.
- Ai generated disease detection and doctor recommendation.
- Both offline and online telemedicine consultation and services.
- Instant and Customized e-prescription and health report through generator.
- Instant medicine and services provided by asha workers based on prescription on our webapp platform.
- Integrated cross platform system which enables patient, doctor and ambulance to work synchronously.
- SOS trigger on Bemax for emergency doctor and ambulance services provided on requested gps location.
- End to End simple and robust solution, optimised and based on real time survey.







USP (Unique Selling Proposition)

- An ecosystem built around local doctors, asha workers, patients, ambulance and services.
- 24/7 multilingual ai bemax health assistant.
- Small, portable, easy to deploy and user-friendly support system.
- Cost-effective at 1/6th the price of current options, easily deployable in diverse locations.
- One stop solution and services provided on both web and Arogya app.
- Consultation can be done in offline mode through gsm module.
- An advanced gps based sos system triggers in the scenario of major emergency.
- To maintain and track the health and medicine record of each patient, we provide report generator to doctors and medical staffs.

Existing Problems/Our Solution

- Current Kiosk's are expensive, requires high electrical input, bulky and are not multilingual supportive.
- Not user-friendly, lacks a conductive ecosystem for seamless operations and growth.
- Lack of awareness especially in rural area.
- Each health aspect is segregated and not well systematic as a whole.
- No existing solution for emergency cases that requires assistance.
- Existing kiosk can't work under extreme terrain as it is more urban oriented.
- As the number speaks, maximum number of existing kiosks are in urban areas and haven't reached rural areas yet.
